

We Rate Dogs

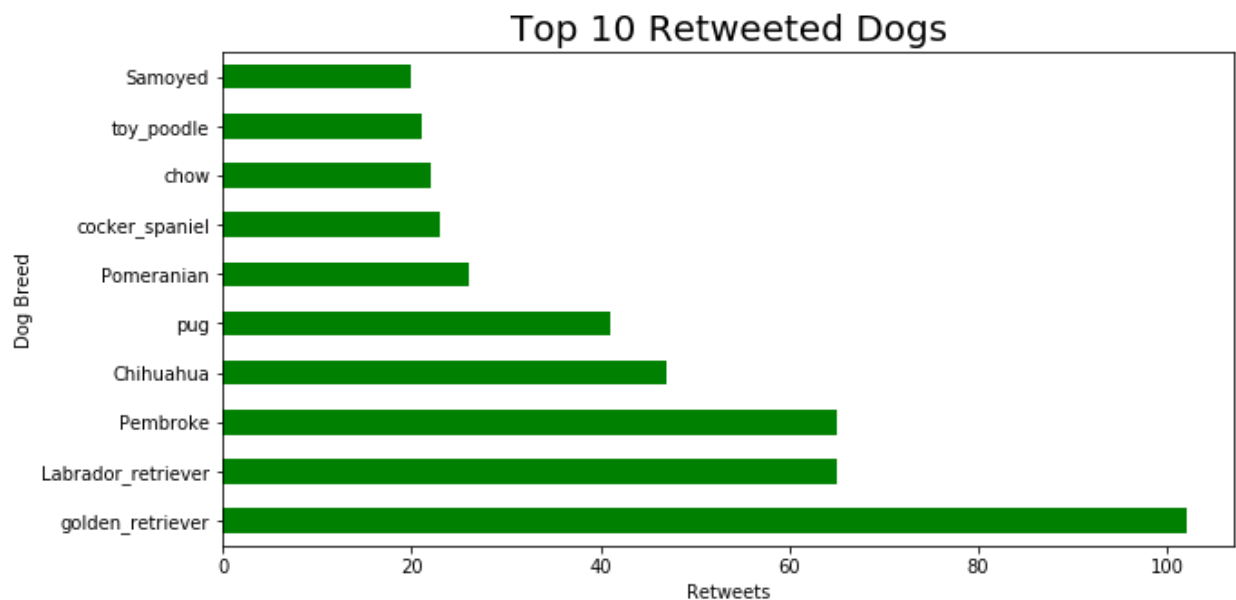

By Mohamed Hassona

Introduction

WeRateDogs is a Twitter account that rates people's dogs with a humorous comment about the dog. It was started in 2015 by college student Matt Nelson, and has received international media coverage both for its popularity and for the attention drawn to social media copyright law when it was suspended by Twitter.

This is a Udacity project "Wrangle and Analyze Data", the goal of the project was to get data from multiple sources from the twitter group We Rate Dogs then assess and clean the data and make a analysis of the data. This is the last stage visualising and presenting the data

What breed of dog gets the most retweets

I found that golden retrievers do well on We Rate Dogs they were the most retweeted and favored dog in the group.

There is a strong positive correlation between retweets and favorites (0.825) this means posts with more retweets tend to have more favorites. This makes sense as you would expect people to share posts they like. It would be interesting to find out if other groups have this same correlation

This was the highest rated post it's a very cute picture of a group of dogs I would like to know how they got them to all stay still like that I can see why they gave it such a high rating.

Conclusion

What I found was golden retrievers had the highest amount of retweets and favourites. The graph for retweets and favourite breeds looks the same this is because of a high correlation between retweets and favourites that was shown in the scatter graph. This dataset was a lot of fun to look through if you have not already you should take a look at We Rate Dogs as it's a very humorous page.
